BRIC: from the laboratory to the bioeconomy

Published: 22 November 2026

News reference: 21 November 2026, BRIC fourth Annual General Meeting, New Delhi.

GS-3: Biotechnology, innovation and the economy.

Prelims: BRIC's institutional identity and bioeconomy targets.

Why in the News

At the fourth Annual General Meeting of the **Biotechnology Research and Innovation Council (BRIC)**, Union Minister Jitendra Singh referred to the ambition of a **USD 300 billion Indian bioeconomy by 2030** and a **USD 1 trillion bioeconomy by 2047**. The meeting was held in New Delhi on 21 November 2026. These are targets, not achieved output or BRIC's own revenue. [1]

What BRIC is

BRIC stands for **Biotechnology Research and Innovation Council**. The Department of Biotechnology's official listing places it in the autonomous-institution category under the Department. It belongs to India's research-institutional system. It should not be confused with the intergovernmental grouping **BRICS** or another similar acronym. [2]

Its model brings institutions together through shared resources, collaborative science and integrated governance while retaining their scientific strengths. The meeting reviewed institutional progress, governance reforms, research collaborations and future priorities. [1]

Understanding the bioeconomy

In simple terms, the **bioeconomy** comprises economic activity using biological knowledge, resources and processes to make useful products or services. It is not a concept limited to pharmaceutical companies. The meeting referred to research in healthcare, agriculture, animal health, sustainable biomaterials and technology platforms. [1]

Biomanufacturing uses biological systems or processes in production. A process working in a laboratory and consistent, quality-controlled production at scale are different challenges. Taking research towards a product therefore requires attention to testing, capital, production capacity and regulatory pathways.

The distance from publication to product

The Minister stressed that scientific achievements should move beyond papers and patents to technologies, products and useful solutions. He called for scientists, entrepreneurs, investors and industry to engage from the early stages. **Research translation**, turning a laboratory discovery into a usable solution, is the central issue in this news. [1]

The account identifies capital, mentorship, industry partnerships and an understanding of markets and regulation as requirements. It mentions initiatives such as an **Entrepreneur-in-Residence programme** as bridges between research and enterprise. None of this proves that every research project has become a commercial product. [1]

Value of a shared institutional model

Sharing costly equipment and scientific capabilities can bring different disciplines to the same problem. A disease-detection technology, for example, may require biology, instrument development and clinical evaluation. This illustrates the model's potential; it is not an announcement of approval for a new product at the meeting.

Integrated administration also requires scientific autonomy and clear accountability. The meeting discussed a proposal concerning dissolution of existing societies of constituent autonomous institutions and their merger with BRIC during restructuring. That should not be presented as proof that every legal step has been completed. [1]

Way forward

Progress should not be assessed through publication counts alone. Validated technologies, user access, scale-up, safe products and social benefit also matter. Industry partnerships should keep public research connected with farmers, patients and communities. Bioeconomy growth depends on a wider ecosystem, not one Council alone.

Mains practice questions

Examine the role of a shared research-institutional model and research translation in achieving India's bioeconomy ambitions. (250 words, 15 marks)

Answer outline

Introduction:
Define the bioeconomy and present the 2030 and 2047 values explicitly as targets.

Main body:
Explain BRIC's shared resources, collaborative science and integrated governance. Discuss capital, testing, scale-up, industry partnership and regulatory understanding between papers/patents and products. Include scientific autonomy, safety, public benefit and accountability as balancing conditions.

Conclusion:
Measure success through scientific quality and useful, safe solutions reaching people. Do not equate the national bioeconomy with BRIC's own revenue.

Frequently asked questions

Are BRIC and BRICS the same?

No. BRIC here is the Biotechnology Research and Innovation Council; BRICS is a grouping of countries.

Has the USD 300 billion target already been achieved?

No. In the 21 November account it is the target for 2030; USD 1 trillion is the target for 2047.

Does obtaining a patent immediately put a product on the market?

No. Testing, regulation, capital and scale-up may still be required.
